Creating a Landing Page. Part I

● Resetting the Default Browser Styles

Browsers can set specific default styles (for example, margin), which is not always convenient. You can reset the default styles by selecting all elements using the “*” symbol.

```
* {  
  margin: 0; /*Resetting margin*/  
  padding: 0; /*Resetting padding*/  
  box-sizing: border-box; /* the size of the element won't exceed the specified value*/  
  font-family: "Roboto" sans-serif; /* setting a font */  
}
```

● Adding Own Basic Styles

As a rule, there are elements with repeating styles on websites. You need to set the same classes to repeating elements to speed up the website development process and make it easier to modify the styles in the future. Then in CSS we can write basic styles for them.

For example, the following class names can be used:

- **container** (for the website section), it should have a width and padding/margin;
- **section-title** (for the headings of each section);
- **section-text** (for the text inside a section).
